

The Origin of Species (Annotated) - Charles Darwin

On December 27, 1831, the young naturalist Charles Darwin left Plymouth Harbor aboard the HMS Beagle. For the next five years, he conducted research on plants and animals from around the globe, amassing a body of evidence that would culminate in one of the greatest discoveries in the history of mankind: the theory of evolution. Darwin presented his stunning insights in a landmark book that forever altered the way human beings view themselves and the world they live in. In *The Origin of Species*, he convincingly demonstrates the fact of evolution: that existing animals and plants cannot have appeared separately but must have slowly transformed from ancestral creatures. Most important, the book fully explains the mechanism that effects such a transformation: natural selection, the idea that made evolution scientifically intelligible for the first time. One of the few revolutionary works of science that is engrossingly readable, *The Origin of Species* not only launched the science of modern biology but also has influenced virtually all subsequent literary, philosophical, and religious thinking.

The Annotated Origin of Species most famous and important work of science of the 19th century: Charles Darwin's *On the Origin of Species*. *The Origin of Species (Annotated)* and millions of other books are available for .
